INTRODUCTION

OBJECTIVES

1. Able to define and manipulate data structures using Data Definition Language (DDL) commands such as CREATE, ALTER, and DROP, as well as Data Manipulation Language (DML) to manage data (INSERT, UPDATE, DELETE).
2. Able to ensure data integrity by applying various constraints to tables, including PRIMARY KEY, FOREIGN KEY, NOT NULL, UNIQUE, and CHECK.
3. Able to retrieve and display data using basic Data Query Language (DQL) SELECT commands, including the use of aliases and arithmetic operators.
4. Able to understand filters and sort retrieved data specifically using the WHERE clause (with comparison, logical, and special operators) and the ORDER BY clause.

MODULE TARGETS

1. Students can create, modify, and drop tables with the correct data types and constraints.
2. Students can perform complex queries using the SELECT command, including basic filtering and sorting, to meet specific data requirements.

PREPARATION

1. Muslim students may recite the following prayer before starting the lesson

رَضِيتُ بِاللّهِ رَبًّا وَبِالْإِسْلَامِ دِينًا وَبِمُحَمَّدٍ نَبِيًّا وَرَسُولًا. رَبِّ زِدْنِي عِلْمًا وَارْزُقْنِي فَهْمًا

2. Oracle 11g XE:

3. Strong motivation and commitment to learning

KEYWORDS

Database, Oracle, SQL, DDL, DML, DQL, Constraints, WHERE, ORDER BY.

MATERIAL

1. WHAT IS SQL?

SQL stands for **Structured Query Language**. It is the standard language used for managing and manipulating data in **Relational Database Management Systems (RDBMS)**. SQL allows users to perform critical tasks like creating database structures, inserting data, modifying records, and querying information for analysis. SQL commands are categorized into four main sublanguages: DDL, DML, DQL, and DCL.

2. DATA DEFINITION LANGUAGE (DDL)

DDL is used to **define, modify, and delete** databases and necessary database objects, such as tables, views, and users. DDL is typically used by database administrators in the creation of database applications. In general, the DDL used is:

Command	Function	Query	Analogy
CREATE	To create a new object in the database, such as a table.	<pre> 1 CREATE TABLE table_name (2 column1 datatype, 3 column2 datatype, 4 column3 datatype, 5 6); </pre>	Preparing a New File Cabinet: You purchase an empty file cabinet, give it a name (table name), and create drawer compartments (columns) while determining the type of items (data type) that can be placed in each drawer.
DESCRIBE	To confirm that the table has been created and view the table details (structure and data types).	<pre> 1 DESCRIBE table_name; </pre>	Check the file cabinet labels to ensure that the drawers (columns) and their sizes (data types) are correct.
USE	To select a specific database/schema as the current active workspace.	<pre> 1 USE database_name; </pre>	Choose which filing cabinet you will use and open today.
ALTER	To modify the structure of an existing object (e.g., add, drop, or modify a column/constraint).	Add column: <pre> 1 ALTER TABLE table_name 2 ADD column_name datatype; </pre> Delete column: <pre> 1 ALTER TABLE table_name 2 DROP COLUMN column_name; </pre> Edit column: <pre> 1 ALTER TABLE table_name 2 MODIFY column_name datatype; </pre>	Modify the cabinets by adding new drawers, removing existing drawers, or changing the size of existing drawers.
DROP	To permanently delete an object (structure and all data) from the database.	<pre> 1 DROP TABLE table_name; </pre>	Discard the entire filing cabinet and all the files in it (Total deletion).

3. DATA MANIPULATION LANGUAGE (DML)

DML is used to **manipulate data** stored in a table, not the table structure itself. These commands are essential for routine data management. Common commands are as follows:

Command	Function	Query	Analogy
INSERT	Used to add new rows of data into a table.	<pre>1 INSERT INTO table_name (column1, column2, ...) 2 VALUES (value1, value2, ...);</pre>	You are placing a new file (a new record/row) into the designated drawers (columns) of the filing cabinet.
UPDATE	Used to modify existing data within the rows of a table. Requires the WHERE clause to specify which rows to change.	<pre>1 UPDATE table_name 2 SET column1 = new_value, column2 = new_value, ... 3 WHERE condition;</pre>	You are opening a file and changing the content inside it, but only the specific file that meets the condition (e.g., changing the address on the 'Steven' file).
DELETE	Used to remove existing rows of data from a table. Requires the WHERE clause to specify which rows to remove.	<pre>1 DELETE FROM table_name WHERE condition;</pre>	You are removing a specific file from a drawer, but the drawer (table structure) itself remains.

4. DATA QUERY LANGUAGE (DQL)

DQL is specifically used to **retrieve or query** data from the database. The primary and most common command is SELECT.

Command	Function	Query	Analogy
SELECT*	To retrieve all columns and all rows from the specified table.	<pre>1 SELECT * FROM table_name;</pre>	Get All the Information: "Please get all the files and provide all the contents (all columns) without exception."
SELECT (Columns)	To retrieve data from specific columns only.	<pre>1 SELECT col1, col2 FROM table_name;</pre>	Get Specific Information: "Please get all the files, but I only need the Name Column and Salary Column ."
SELECT DISTINCT	To retrieve unique (non-duplicate) values from the specified column(s).	<pre>1 SELECT DISTINCT col1 FROM table_name;</pre>	List Without Repetition: "Please list all job titles in this company, but do not repeat any (only list the different ones)."

5. DATA TYPES

Data Types specify the kind of data that can be stored in a column, such as numbers, characters, or dates. Choosing the correct data type is crucial for efficient storage and accurate data manipulation.

Data Type	Description	Analogy
VARCHAR2 (size)	Variable-length character data. Stores text and characters up to a specified maximum size (e.g., 255). It saves space because it only uses the size required by the actual data.	Flexible Plastic Bag: A drawer that can adjust its size to fit the contents (text). If you write 'A' (1 character), only 1 space is used, and the rest is saved.
CHAR (size)	Fixed-length character data. Always reserves the maximum specified size, even if the actual data is shorter.	Rigid Paper Box: Drawers that are always the same size (for example, 50 spaces). Even if you only write 'A', it still takes up 50 spaces.

NUMBER (p, s)	Numeric data used for storing whole numbers or decimals. <i>p</i> is precision (total digits), and <i>s</i> is scale (digits to the right of the decimal point).	Special Cash Drawer: A drawer that only accepts numbers (all types of currencies). We determine how many total digits can be entered (<i>p</i>) and how many digits after the decimal point (<i>s</i>).
DATE	Stores date and time values, including year, month, day, hour, minute, and second.	Time Stamp: Used to record the exact date and time of an event (for example, when a file was created or modified).

6. DATE DATA TYPES

These types provide more advanced time storage capabilities, often including timezone information and fractional seconds.

Data Type	Description	Analogy
TIMESTAMP	Stores date and time data with seconds and fractional seconds (very precise time measurement).	Stopwatch Watch: More accurate than a regular time stamp, because it records time down to fractions of a second (milliseconds).
INTERVAL YEAR TO MONTH	Stores a span or duration of time in terms of years and months (e.g., "3 years and 2 months").	Project Duration: Stores the time period between two dates measured only in Years and Months.
INTERVAL DAY TO SECOND	Stores a span or duration of time in terms of days, hours, minutes, and seconds .	Travel Duration: Stores the time period between two events measured in Days, Hours, Minutes, and Seconds.

7. DEFAULT OPTIONS

DEFAULT option is used when creating a table to **automatically assign a value** to a column if a new row is inserted and **no specific value** is provided for that column. Example:

```
1 CREATE TABLE Students (  
2     StudentID NUMBER PRIMARY KEY,  
3     Name VARCHAR2(100) NOT NULL,  
4     EnrollmentDate DATE DEFAULT SYSDATE,  
5     StudentStatus VARCHAR2(10) DEFAULT 'Active' );
```

Analogy:

Automatic Status Setting: When a student is first inserted into the system, their **StudentStatus** is **automatically set to 'Active'** unless specified otherwise. The **EnrollmentDate** is automatically set to the **current date**.

8. CONSTRAINTS

Constraints in SQL are rules or restrictions applied to tables to ensure data remains **consistent and accurate**. They ensure that values in certain columns comply with specific rules, such as not being NULL, being unique, or referring to values in other tables.

Constraints	Function	Query	Analogy
PRIMARY KEY	Uniquely identifies each row in a table. It cannot be NULL and must be unique.	id NUMBER PRIMARY KEY	Student Identification Number (NIS): The main identity card that must be owned and cannot be duplicated .
FOREIGN KEY	Creates a link (relationship) between two tables. It must refer to a value that already exists in the primary key column of another table.	FOREIGN KEY (id_major) REFERENCES Major(id)	Graduate Certification: A column that only accepts values (e.g., Department ID) that are already recorded as valid in the reference table (Department Table).
NOT NULL	Ensures that the column cannot contain a null (empty) value .	name VARCHAR2(50) NOT NULL	Required Fields: Sections of the form that must be filled in and cannot be left blank .
UNIQUE	Ensures that all values in a column are unique (no duplicates allowed), but it can contain NULL values.	email VARCHAR2(100) UNIQUE	Mobile Number: Everyone must have a different mobile number, but not everyone is required to include it (optional).
CHECK	Defines a condition that must be met by the data inserted into the column.	CHECK (age >= 17)	Age Restriction Filter: A rule that ensures the data entered meets logical requirements (for example, the Age value must be above 17 years old).

Implementing Constraints: Step-by-Step Guide:

This guide details the creation of the core academic tables, defining all necessary constraints (PK, FK, NOT NULL, CHECK, UNIQUE), and testing data integrity.

Step 1: Establish Base Tables (MAJORS and LECTURERS)

Create the foundational tables first, as they contain the primary keys referenced by all other tables.

```

1  CREATE TABLE MAJORS (
2      MajorID NUMBER(3) PRIMARY KEY,
3      MajorName VARCHAR2(100) NOT NULL UNIQUE
4  );

```

```

6  CREATE TABLE LECTURERS (
7      LecturerID NUMBER(5) PRIMARY KEY,
8      LecturerName VARCHAR2(100) NOT NULL,
9      Email VARCHAR2(100) UNIQUE,
10     MajorID NUMBER(3),
11     -- Foreign Key Definition
12     CONSTRAINT FK_LecMajor FOREIGN KEY (MajorID) REFERENCES MAJORS (MajorID)
13 );

```

Step 2: Create Transactional and Entity Tables (STUDENTS and COURSES)

Implement tables that rely on the base tables, including more complex constraints like CHECK and DEFAULT.

```

15 CREATE TABLE STUDENTS (
16     NIM VARCHAR2(10) PRIMARY KEY,
17     FullName VARCHAR2(100) NOT NULL,
18     MajorID NUMBER(3),
19     GPA NUMBER(3, 2) CHECK (GPA BETWEEN 0.00 AND 4.00),
20     EnrollmentYear NUMBER(4),
21     -- Default Option
22     Status VARCHAR2(10) DEFAULT 'Active',
23     -- Foreign Key Definition
24     CONSTRAINT FK_StudMajor FOREIGN KEY (MajorID) REFERENCES MAJORS (MajorID)
25 );

```

```

27 CREATE TABLE COURSES (
28     CourseCode VARCHAR2(5) PRIMARY KEY,
29     CourseName VARCHAR2(100) NOT NULL,
30     Credits NUMBER(1) CHECK (Credits BETWEEN 2 AND 4),
31     LecturerID NUMBER(5),
32     -- Foreign Key Definition
33     CONSTRAINT FK_CourseLec FOREIGN KEY (LecturerID) REFERENCES LECTURERS (LecturerID)
34 );

```

Step 3: Demonstrate Data Integrity Violation

After table creation, test the system's ability to reject bad data based on the defined rules.

A. Foreign Key Violation (Referential Integrity)

Goal: Attempt to enroll in a course with a non-existent lecturer ID.

- **Assumption:** Lecturer ID 999 does not exist in the **LECTURERS** table.
- **Violating Query:**

```
1  INSERT INTO COURSES (CourseCode, CourseName, Credits, LecturerID)
2  VALUES ('DB101', 'Database Fundamentals', 3, 999);
```

- **Expected Outcome:** The database will reject the insertion.

```
ORA-02291: integrity constraint (WKSP_TEAMBASISDATA.FK_COURSELEC) violated - parent
key not found
```

B. CHECK Constraint Violation (Domain Integrity)

Goal: Attempt to insert a student with an invalid GPA value (e.g., above 4.00).

- **Violating Query:**

```
1  INSERT INTO STUDENTS (NIM, FullName, MajorID, GPA)
2  VALUES ('2025101', 'Andi Nugraha', 101, 4.50);
```

- **Expected Outcome:** The database will reject the insertion.

```
ORA-02290: check constraint (WKSP_TEAMBASISDATA.SYS_C00190173058) violated
```

9. BASIC SELECT COMMANDS

1. Retrieving All Columns (SELECT *)

Displays all columns and all rows from the specified table.

- Query:

```
1 SELECT * FROM MAJORS;
```

- Expected Output:

MAJORID	MAJORNAME
101	Informatika
102	Sistem Informasi
103	Teknik Elektro

- **Purpose:** To retrieve all details of every Major.

2. Retrieving Specific Columns

Retrieves only the necessary column names separated by commas.

- Query:

```
1 SELECT LecturerName, Email
2 FROM LECTURERS;
```

- Expected Output:

LECTURERNAME	EMAIL
Prof. Cahyo Wibowo	cahyo.w@univ.ac.id
Dr. Budi Santoso	budi.s@univ.ac.id
Ir. Siti Aisyah	siti.a@univ.ac.id

- **Purpose:** To retrieve only the name and email of the lecturers.

3. Eliminating Duplicates (SELECT DISTINCT)

Eliminates duplicate rows in the result set, ensuring each unique value appears only once.

- **Query:**

```
1  SELECT DISTINCT MajorID
2  FROM LECTURERS;
```

- **Expected Output:**

MAJORID
101
102

- **Analogy:** "Show all the different Major IDs that lecturers belong to, but do not repeat the same ID."

4. Arithmetic Operations

Performs arithmetic calculations (+, -, *, /) on number columns.

- **Query:**

```
1  SELECT CourseName, Credits, Credits * 16 AS "Total_Hours"
2  FROM COURSES;
```

- **Expected Output:**

COURSENAME	CREDITS	Total_Hours
Basis Data	3	48
Analisis Sistem	4	64
Jaringan Komputer	2	32
Pemrograman Dasar	3	48

- **Analogy:** "Take the value from the **Credits** column and **multiply it by 16** to create a new output column named 'Total_Hours'."

5. Concatenation (||)

Combines two or more columns into a single output string.

- **Query:**

```
1 SELECT FullName || ' (' || EnrollmentYear || ')' AS "Student_Angkatan"
2 FROM STUDENTS;
```

- **Expected Output:**

Student_Angkatan
Andi Nugraha (2024)
Eka Fitriani (2022)
Doni Setiawan (2023)
Budi Cahyono (2023)
Citra Dewi (2024)
5 rows returned in 0.03 seconds Download

- **Analogy:** "Stitch the Student Name, a parenthesis, and the Enrollment Year together to form one detailed string."

10. INTRODUCTION TO DATA FILTERING (WHERE CLAUSE)

The WHERE clause is an essential component of the DQL (SELECT) command. It acts as a **filter** in your SQL query, specifying which rows must meet a certain **condition** to be included in the final result set.

Operator	Function	Query	Analogy
WHERE	Selecting rows that meet a certain condition.	SELECT * FROM STUDENTS WHERE GPA > 3.50;	Take all the files, BUT only students with a GPA above 3.50.
AND / OR	Combining two or more conditions.	WHERE MAJOR = 'Informatics' AND ENROLLMENT_YEAR = 2024;	Take the file if the major is "Informatics" AND the year of entry is 2024.

11. INTRODUCTION TO DATA SORTING (ORDER BY CLAUSE)

The ORDER BY clause is used to define the **order** in which the result set is displayed. This operation is performed **after** the data has been filtered and retrieved, making it the final logical step in presenting data.

Keyword	Function	Query	Analogy
ORDER BY	Sort results based on the specified column.	SELECT NAME, GPA FROM STUDENTS ORDER BY GPA DESC;	After the data is collected, SORT it based on GPA.
DESC / ASC	DESC (Descending): from largest/newest to smallest/oldest. ASC (Ascending): from smallest/oldest to largest/newest (default).	... ORDER BY ENROLLMENT_YEAR DESC;	Sort students by Year of Entry FROM NEWEST to OLDEST.

SUMMARY MODULE 4 – BASIC SQL

Query	How to Read in Indonesian (Brief Analogy)
CREATE TABLE Students (...);	Buat tabel Students
ALTER TABLE Students ADD Email...;	Tambah kolom Email di tabel Students
DROP TABLE Students;	Hapus tabel Students
INSERT INTO Students VALUES (...);	Tambahkan data baru ke tabel Students
UPDATE Students SET ... WHERE NIM='2024...';	Ubah data mahasiswa tertentu
DELETE FROM Students WHERE NIM='2024...';	Hapus satu data mahasiswa
SELECT * FROM Students;	Tampilkan semua data Students
SELECT FullName, GPA FROM Students;	Tampilkan hanya Nama dan GPA
SELECT DISTINCT MajorID FROM Students;	Tampilkan daftar jurusan tanpa duplikat
SELECT * FROM Students WHERE GPA > 3.5;	Tampilkan mahasiswa dengan IPK di atas 3.5
WHERE GPA > 3.5 AND MajorID = 101	Filter: IPK > 3.5 dan jurusan 101
ORDER BY GPA DESC	Urutkan data dari IPK tertinggi ke terendah
PRIMARY KEY (NIM)	NIM sebagai identitas unik mahasiswa
FOREIGN KEY (MajorID)	Hubungkan ke tabel Jurusan
NOT NULL	Kolom wajib diisi
UNIQUE	Nilai tidak boleh kembar
CHECK (GPA BETWEEN 0 AND 4)	Nilai hanya boleh antara 0 sampai 4

PRACTICE ACTIVITY

A. TUTORIAL ON EXPORTING DATABASES IN ORACLE 11g XE

1. **Download Oracle 11g XE** and then install it ([LINK_ORACLE 11G XE](#)). When the installation process appears as shown below, enter the password as recommended, which is **SYS** or **SYSTEM** (capital letters are optional). This password will be used to log in to the Oracle database, **so it is important to remember it**.

2. Run Oracle 11g XE and select “Application Express” on the main page.

3. Log in using the account created in step 1.

4. Create an empty database as a workspace.

- **Database User** - There are options to Create New (create a new database) or Use (use an existing database such as HR). In this exercise, we will create a new database.
- **Database Username** - You can use the provided database or create your own username.
- **Application Express Username** - To name the Workspace, try to make this name the same as the database username.
- **Procedures for Creating a New Workspace:**
 1. Select the "Create New" radio button under "Database User".
 2. Enter the user name for the new database schema to be created (Example: **Online_Shop**).
 3. Enter the login name you will use to log in to the APEX Workspace environment (Example: **Online_Shop**).
 4. Enter the passwords for both users above (Database User and Application Express User). **Use the same password you**

use to log in to the Oracle database, and don't forget the password.

ORACLE® Oracle Database XE 11.2

Home Storage Sessions Parameters **Application Express**

Home > Oracle Application Express

Create Application Express Workspace

Cancel **Create Workspace**

Database User ☒ Create New ☐ Use Existing

* Database Username

* Application Express Username

* Password

* Confirm Password

5. After all required fields (Database Username, Application Express Username, and Password) are filled in, click the **"Create Workspace"** button (red button).
6. After the process is complete, click the **"Already have an account? Login Here"** button.

11.2 Welcome: SYS Logout

Application Express

Cancel **Create Workspace**

Getting Started

Already have an account? Login Here

To get started with Oracle Application Express, create a workspace. You will need to specify:

- Database Username - Name of the database user to be created
- Application Express Username - Your login name for the Application Express Workspace
- Password - Password of both your database user and Application Express user

Once created, you will be able to [login to your Application Express workspace](#) using these credentials

Oracle

7. Enter Credentials:

- Workspace: Enter the name of the workspace you just created (usually the same as your Application Express Username, Example: **ONLINE_SHOP**).
- Username: Enter your Application Express Username (Example: **ONLINE_SHOP**).
- Password: Enter the password you created.
- Click **login** to enter the workspace page.

5. How to Export Databases to SQL Scripts

1. On the Workspace (ONLINE_SHOP) main page, click the “**SQL Workshop**” icon or menu.

- In the SQL Workshop menu, click on the “SQL Scripts” submenu.

- Click the “Upload” button.

- Download and then upload this schema file ([LINK FILE SCHEMA ONLINE SHOP](#)). Give the script the name “Online_Shop”. After that, click the “Upload” button.

5. Click **"RUN"**

6. Click button **"Run Now"**

7. Now that the Online_Shop schema has been successfully exported, the next step is to click **"SQL Commands"** to write the query code.

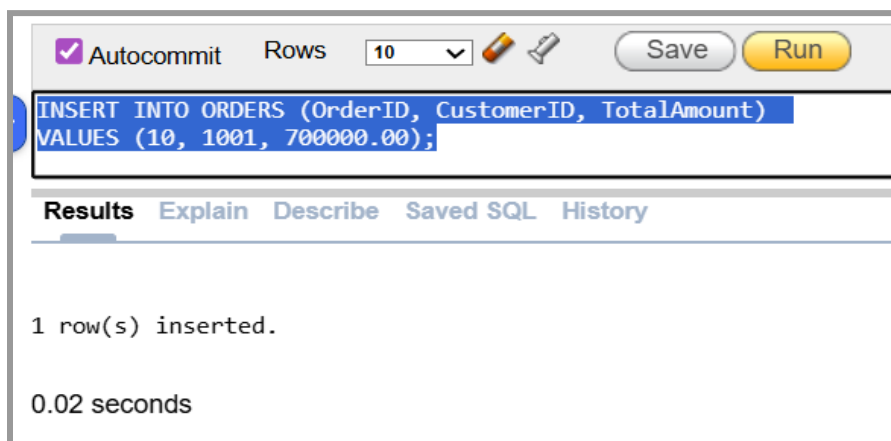

8. Check one of the tables (entities) to ensure that the database export was created using the query.

9. When you run the query for the first time, the result you will get is **"data not found"**, which means that you have not entered any data into the database because the database you created is still empty.

10. Try entering one piece of data into one of the entity databases to see the form of the database you have built. **You can select the query syntax to be executed and then click the "Run" button.**

11. If there are no red error messages, then you have successfully exported the database. Validate by calling the orders table.

The screenshot shows a database query interface. At the top, there is a toolbar with a checked "Autocommit" checkbox, a "Rows" dropdown set to "10", and "Save" and "Run" buttons. Below the toolbar is a text area containing the SQL query: `SELECT * FROM ORDERS;`. Underneath the query area is a tabbed interface with "Results" selected. The results are displayed in a table with the following columns: ORDERID, CUSTOMERID, ORDERDATE, and TOTALAMOUNT. The table contains one row of data: ORDERID 10, CUSTOMERID 1001, ORDERDATE 12/15/2025, and TOTALAMOUNT 700000. Below the table, it states "1 rows returned in 0.01 seconds" and provides a "Download" link.

ORDERID	CUSTOMERID	ORDERDATE	TOTALAMOUNT
10	1001	12/15/2025	700000

1 rows returned in 0.01 seconds [Download](#)

B. ORACLE APEX: PRACTICAL SQL SOLUTIONS (BACKUP)

Oracle Application Express (APEX) is a web-based interface that allows you to run SQL commands directly through your browser. [LINK_ORACLE APEX](#)

Key Points:

1. **Cross-Platform Solution:** APEX is the perfect solution for **macOS** and other operating system users who have difficulty installing Oracle Database XE locally. All you need is an internet connection.
2. **Backup Environment:** APEX serves as a stable backup practice environment. If your local Oracle 11g XE database encounters an error, APEX is ready to use.
3. **Syntax Similarity:** The SQL commands you use in APEX (DDL, DML, DQL) are exactly the same as those used in Oracle 11g XE. The only difference is in the tool interface.
4. **Set Up a Backup:** Don't forget to create your free APEX Workspace account as a backup in case of problems with your local Oracle XE installation.

QUERY DOCK

In the **Practice Activity** section, we have entered data into the **ORDERS** table. Now, your task is to complete the data in the other three tables so that our Online Shop database is complete. Fill in the blanks (___) with the appropriate keywords or values!

1. Insert Customer Data (CUSTOMERS)

☒ Autocommit
 Rows

Save Run

```

___A___ INTO CUSTOMERS (CustomerID, CustomerName, Email)
VALUES (1001, 'Budi Cahyono', 'budi@mail.com');
    
```

2. Insert Product Data (PRODUCTS)

☒ Autocommit
 Rows

Save Run

```

INSERT INTO ___B___ (ProductID, ProductName, Price, Stock)
___C___ ('A001', 'T-Shirt Casual', 150000.00, 50);
    
```

☒ Autocommit
 Rows

Save Run

```

INSERT INTO PRODUCTS (ProductID, ProductName, Price, Stock)
VALUES ('A002', 'Sepatu Lari X', 550000.00, 20);
    
```

3. Insert Order Details Data (ORDER_DETAILS)

☒ Autocommit
 Rows

Save Run

```

INSERT INTO ORDER_DETAILS (___D___, OrderID, ProductID, Quantity, Subtotal)
VALUES (2, 10, 'A001', 1, 150000.00);
    
```

☒ Autocommit Rows: 10   Save Run

```
INSERT INTO ORDER_DETAILS (OrderDetailID, OrderID, ___E___, Quantity, Subtotal)
VALUES (1, 10, 'A002', 1, 550000.00);
```

After all data has been successfully entered, run the following commands in sequence to display the entire contents of your table. Make sure all data (including the blank data you just filled in) appears correctly!

1. Show all Customers:

☒ Autocommit Rows: 10   Save Run

```
SELECT * FROM CUSTOMERS;
```

2. Show all Products:

☒ Autocommit Rows: 10   Save Run

```
SELECT * FROM PRODUCTS;
```

3. Show all Orders:

☒ Autocommit Rows: 10   Save Run

```
SELECT * FROM ORDERS;
```

4. Show all Order Details:

The screenshot shows a database query interface. At the top, there is a toolbar with a checked 'Autocommit' checkbox, a 'Rows' dropdown menu set to '10', and icons for a pencil (edit) and a paper plane (execute). To the right of these are 'Save' and 'Run' buttons. Below the toolbar is a text area containing the SQL query: `SELECT * FROM ORDER_DETAILS;`

Note: If all the data appears, congratulations! You have succeeded. Show the results to the Assistant.

ASSIGNMENT

Task instructions:

1. Add at least 3 data to each main table (INSERT).
2. Display all data from one of the tables (SELECT).
3. Display data with certain conditions (WHERE).
4. Change one data (UPDATE).
5. Delete one data (DELETE).

This task is based on the schema theme you created in the previous module (in SQL Developer). Please upload your schema DDL file to Oracle 11g XE. To upload the DDL file, follow these steps (the image below is only an example, please use the schema theme you have created):

1. Perform the CDM to PDM conversion as taught in the module 2 tutorial.

2. Then, switch to the Relational Data Model, select all the tables/entities you have created by drafting or pressing CTRL + A, right-click and select the "DDL Preview" menu. Copy all available DDLs.

3. Then, copy the entire SQL program.

```

1 CREATE TABLE Dealer
2 (
3     id_dealer      INTEGER NOT NULL ,
4     nama_dealer    VARCHAR2 (255 CHAR) NOT NULL ,
5     lokasi_dealer  VARCHAR2 (255 CHAR) NOT NULL ,
6     mobil_id_mobil INTEGER NOT NULL ,
7     mobil_id_dealer INTEGER NOT NULL
8 )
9 ;
10 CREATE UNIQUE INDEX Dealer_IDX ON Dealer
11 (
12     mobil_id_mobil ASC ,
13     mobil_id_dealer ASC
14 )
15 ;
16
17 ALTER TABLE Dealer
18     ADD CONSTRAINT Dealer_PK PRIMARY KEY ( id_dealer ) ;
19
20 CREATE TABLE mobil
21 (
22     id_mobil        INTEGER NOT NULL ,
23     merk_mobil      VARCHAR2 (255 CHAR) NOT NULL ,
24     seri_mobil      VARCHAR2 (255 CHAR) NOT NULL ,
25     jenis_mobil     VARCHAR2 (255) NOT NULL ,
26     jumlah_tersedia INTEGER NOT NULL ,
27     id_dealer       INTEGER NOT NULL
28 )
29 ;
30
31 ALTER TABLE mobil
32     ADD CONSTRAINT mobil_PK PRIMARY KEY ( id_mobil, id_dealer ) ;
33
34 ALTER TABLE Dealer
35     ADD CONSTRAINT Dealer_mobil_FK FOREIGN KEY
36     (
37         mobil_id_mobil,
  
```

4. Open the DDL File Editor and paste all the DDL you copied earlier.

5. Save the DDL file you have created in the location you want.

```

1 CREATE TABLE Dealer
2 (
3     id_dealer      INTEGER NOT NULL ,
4     nama_dealer    VARCHAR2 (255 CHAR) NOT NULL ,
5     lokasi_dealer  VARCHAR2 (255 CHAR) NOT NULL ,
6     mobil_id_mobil INTEGER NOT NULL ,
7     mobil_id_dealer INTEGER NOT NULL
8 )
9 ;
10 CREATE UNIQUE INDEX Dealer_IDX ON Dealer
11 (
12     mobil_id_mobil ASC ,
13     mobil_id_dealer ASC
14 )
15 ;
16
17 ALTER TABLE Dealer
18     ADD CONSTRAINT Dealer_PK PRIMARY KEY ( id_dealer ) ;
19
20 CREATE TABLE mobil
21 (
22     id_mobil      INTEGER NOT NULL ,
23     merk_mobil    VARCHAR2 (255 CHAR) NOT NULL ,
24     seri_mobil    VARCHAR2 (255 CHAR) NOT NULL ,
25     jenis_mobil   VARCHAR2 (255) NOT NULL ,
26     jumlah_tersedia INTEGER NOT NULL ,
27     id_dealer     INTEGER NOT NULL
28 )
29 ;
  
```

6. Upload the DDL file you created in SQL Developer to Oracle 11g xe and name the script you are uploading (To upload a DDL file to Oracle 11g xe, follow the same steps as in PRACTICE ACTIVITY instruction number 5).
7. Once you have successfully completed this, please proceed to Instructions 1 through 5. When you are done, show your results to the lab assistant. Keep up the good work! 😊

PRACTICUM GRADING RUBRIC

Assessment Aspects	Points
Query Dock	Total 15%
INSERT INTO correct	3%
Table name is correct	3%
Keyword VALUES correct	3%
All tables can be displayed	6%
Assignment	Total 45%
INSERT ≥ 3 data per table	15%
SELECT + WHERE correct	15%
UPDATE + DELETE correct	15%
Material Understanding	Total 40%
Explains query parts	10%
Explains table-column relation	10%
Explains INSERT logic	10%
Explains UPDATE / DELETE logic	10%

Important Notes on Practicum Implementation

During **Query Dock** week, students are encouraged to **ask questions** about module 4 material that they do not yet understand. This session not only tests syntax, but also helps students deepen their understanding of SQL concepts through discussions with assistants.

The **Query Dock score has a small percentage**, so the main focus of the assessment remains on **understanding the material** and the student's ability to explain the logic of the query. For each assessment item on the rubric:

- **100** → **Correct and confident answer / clear explanation**
- **50** → **Partially correct answer / still uncertain**
- **0** → **Unable to answer / does not follow instructions**

With this scheme, assessment is carried out objectively and consistently according to the level of student mastery.
